

1 Context Menu of the Design View

The context menu of the Design View allows the user to use most of the view's features via right-click.

- To delete an XML Object, right-click it and select "Delete".
- To insert a DOCTYPE declaration in your document, right-click at any position in the editing view and select "Add DTD Information...".
- To add new or edit existing namespaces in the document, right-click at any position in the editing view and select "Edit Namespaces...".
- Processing instructions can be edited in a pop-up window after "Add Processing Instruction" has been selected.
- To add an element at a certain position relative to an element in the document, right-click it and choose one of the elements proposed. When selecting "Add Child", "Add Before" or "Add After", you can add the following elements:
 - a comment
 - a processing instruction
 - PCDATA 
 - a CDATA section
 - a new element 
- You can add attributes to an element by right-clicking it and selecting from the list proposed after selecting "Add Attribute" .
- To edit attributes, right-click the attribute in the Design View and select "Edit Attribute...".

The lists of proposed elements and attributes are provided by Content Assist. Proposals come from a referenced content model if a schema is specified for the document, or through the XML catalog if a schema is not specified. This will give you "smarter" proposals, such as specific child element proposals within a given element, or required attribute proposals.
