

1 Export

The Export function can be used to export TextGrid Objects and their metadata to a local hard disk or a storage medium. During the export process, the tool will create two files for every Object that has been exported to the target directory on the local operating system: one for the data named with the Object's URI and an additional file that contains the Object's metadata in XML form. For complex Objects like Editions, directories are created that list their contents.
