

1 Items

Items are the simplest, but also most common entities in TextGrid. An Item may be a page scan or a chapter of an edition in the form of an XML document. A range of Items can be created via the green cross icon in the toolbar: XML documents, Text Image Link Objects, plain text documents, stylesheets and musical notation sheets. Items are dependent Objects: They can only be [published](#) as part of an Edition or Collection but not by themselves. Descriptive metadata for an Item generally consists of one or more titles of the file, its format, a rights holder, and the identifying technical metadata that is available for all Objects. To associate more sophisticated metadata such as an author or a source description with an Item, put it into an [Edition](#) and optionally associate a [Work](#). For more information about how to put Items into an Edition or to associate a Work to an Edition, please see the chapter "[References between Objects](#)".
