1 Custom Charset Editor

▬ This editor shows a list of currently existing character sets in the head area. The body contains a toolbar for inserting, deleting and saving the character sets. The footer displays the values of the currently selected character set and allows it to be modified using the following options:

- Click the ✚ button to create a new set.

  To delete a set click ▬ or right-click the set to delete it from the list.
- Use the ⟳ to refresh the list.
- Furthermore you can save the set outside TextGrid and import external sets by clicking 📥 or 📄.

The name and icon of the character set can be changed as well as the content, which consists of either a predefined Unicode blockset or a custom list of Unicode characters. These characters can be entered as a decimal Unicode character code point (e.g. "56789"), as a Unicode hexadecimal code point with a leading sign (e.g. "U+1D100"), or as a directly inserted symbol from the system clipboard. The selected signs must be separated by semicolons. Click "Close" to save the charset.
